Odor coding by a Mammalian receptor repertoire

Saito et al. Sci signals 2009

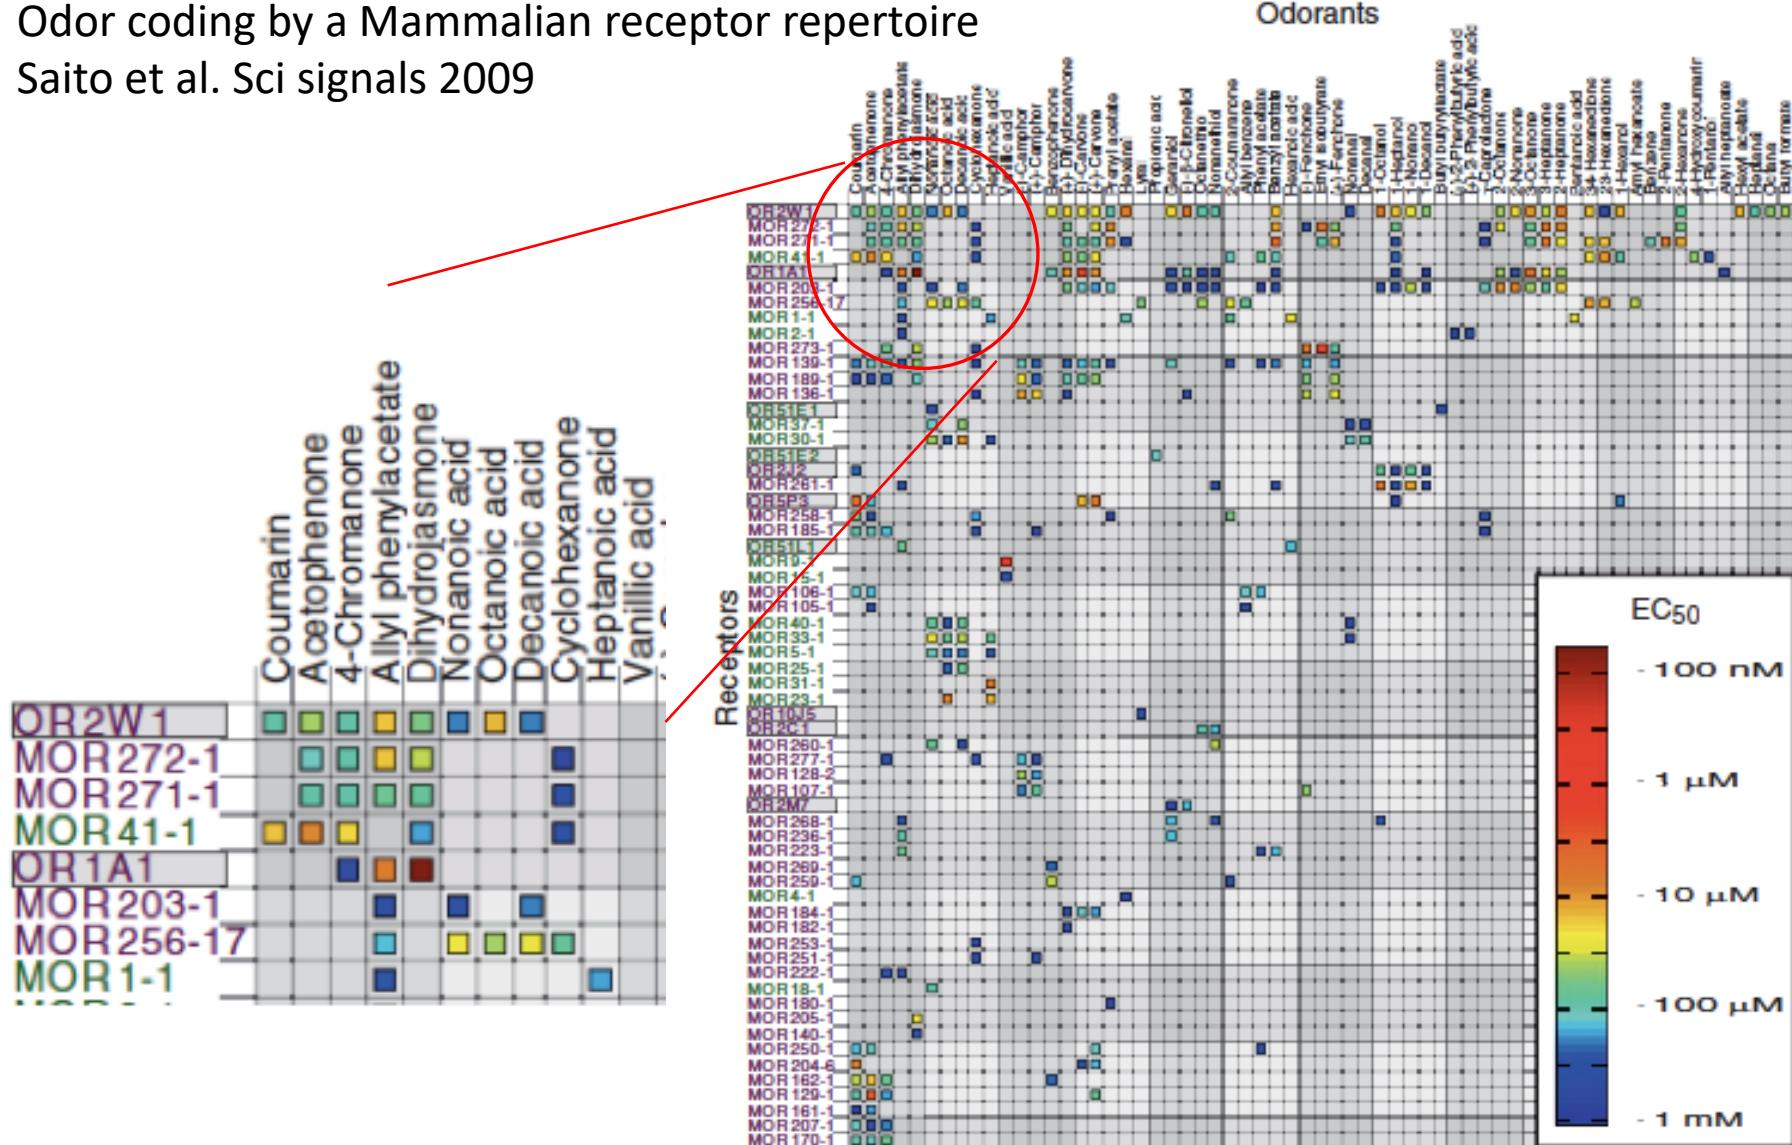

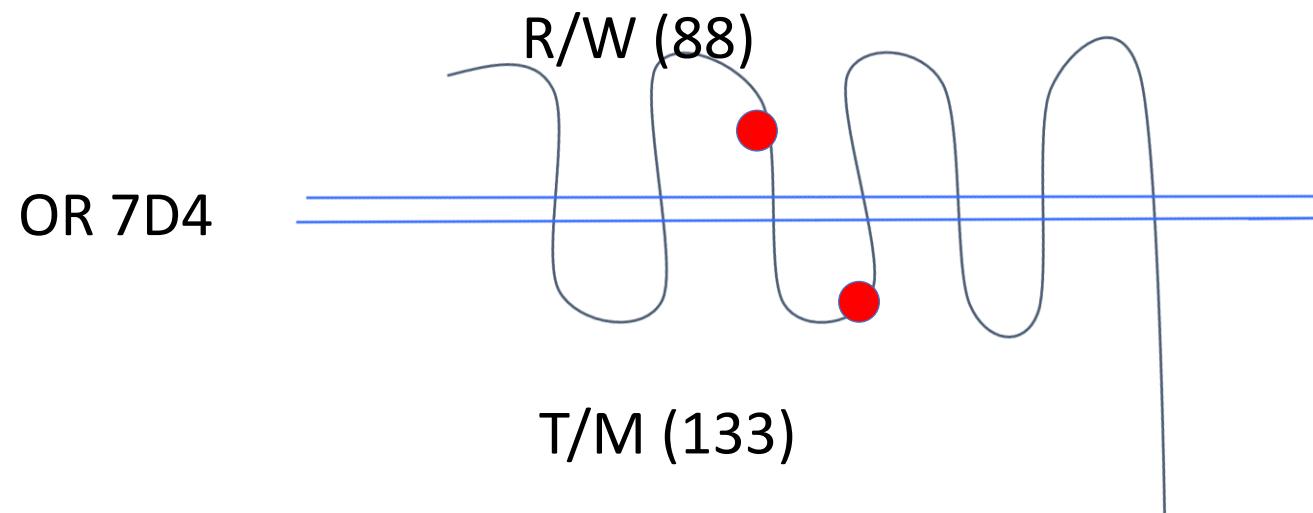

Fig. 1. EC₅₀ values for 62 ORs and 63 odorants. Class I receptors are shown in green, and class II receptors in purple. Human ORs have a gray background. Odorant and receptor order were determined independently by cluster analysis with the receptor response data such that

the most similar odorants (and receptors) are next to each other on their respective axes. A second version of this figure, with odorant order determined by functional group and receptor order determined by number of agonists is included for comparison (fig. S10).

- Un OR peut lier différentes molécules chimiques (odorants)
- Une molécule chimique donnée se lie à plusieurs OR différents

Il s'agit d'un **code combinatoire**

Polymorphisme et fonctionnalité

RT = good responder

WM = poor responder

In vitro

In vivo

28% RT/RT people do not detect androstenone
46% RT/WM people do not detect androstenone

The RT/RT group detect androstenone at lower concentration 1/16

RT/WM people find androstenone less unpleasant, than the RT/RT people

Chez le chien

Fréquence moyenne des SNP dans les gènes OR = 1 SNP/529nt

Fréquence moyenne SNP dans les autres gènes 1 SNP / 8631 nt

Expression des OR (c.a.d. DNA RNA Protéine)

- Un seul des deux allèles est exprimé par OSN
- Mais les deux sont exprimés

**Figure 3**

The number of predicted human OR genes whose expression was detected (at $P < 0.05$) in one or more of the three olfactory epithelium (OE) samples. As can be seen, there is a substantial difference in the expressed OR gene repertoire of each of the three OE samples.

- Il existe de grandes différences quantitatives et/ou qualitatives de perception olfactive entre individus

Questions:

Pourquoi certains OR sont exprimés et pas d'autres?

Quel mécanisme ou facteurs sélectionnent l'OR à exprimer par un OSN donné ?

Les gènes exprimés et leur niveau d'expression sont –ils modulables en fonction des circonstances?

- Obstruction nasale

rhinite, congestion, inflammation des sinus etc

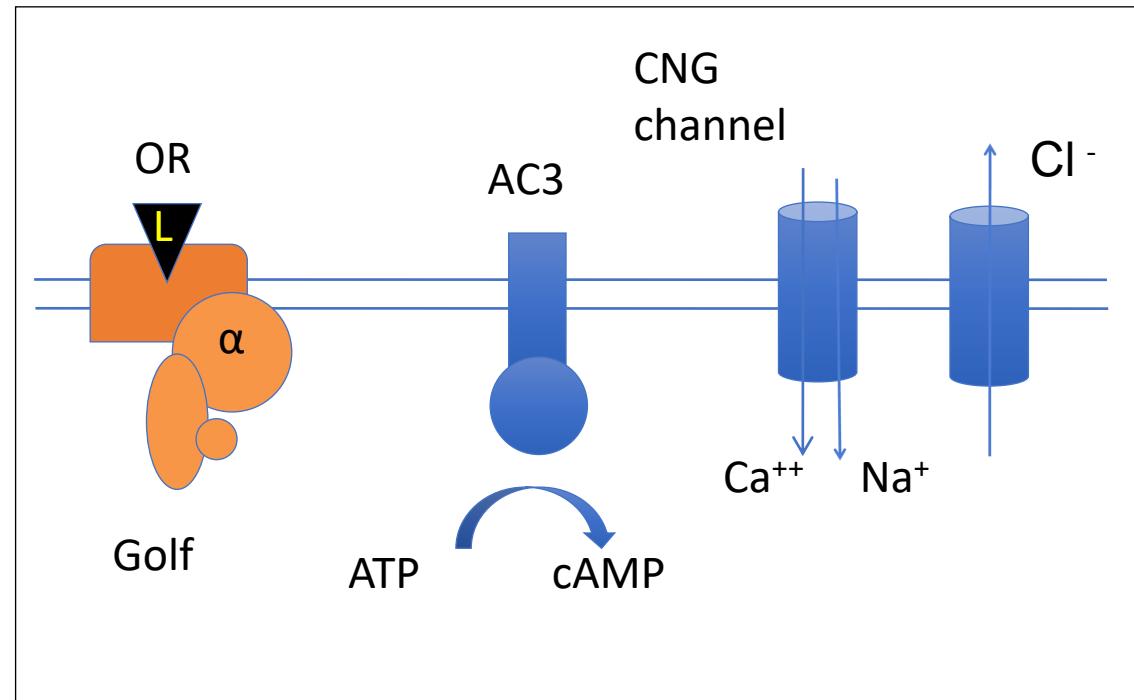

- Problèmes Sensoriels

fumeurs actifs ou passifs (risque important)

- Disfonctionnement cérébral

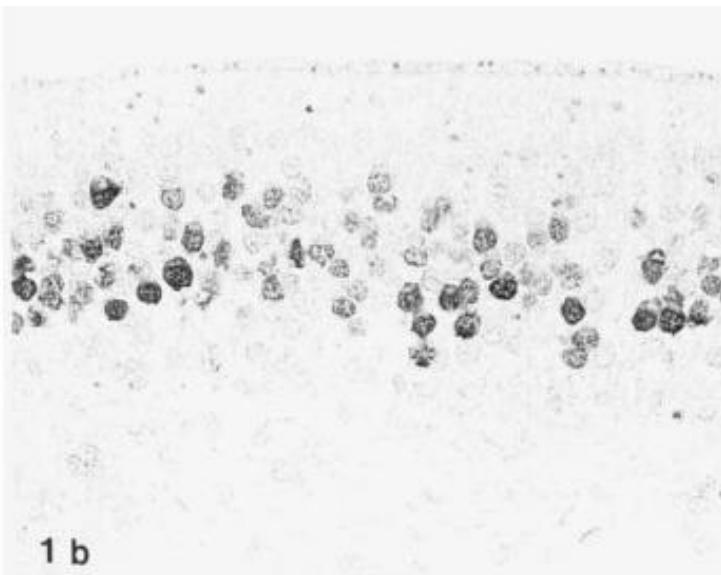

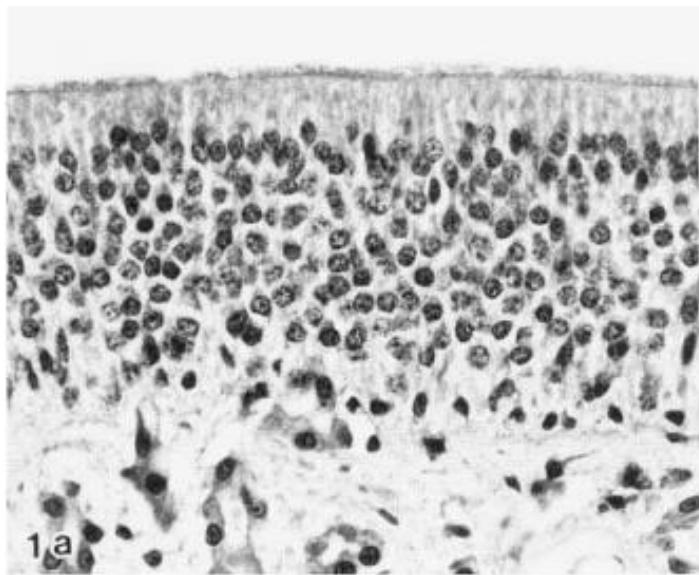

Alzheimer and Parkinson.

B Expressed olfactory receptor genes

The Claus Wedekind experiment: MHC and sexual selection

Wedekind, C. et al. (1995). "MHC-dependent preferences in humans".
Proceedings of the Royal Society of London 260 (1359): 245–49.

Le complexe majeur d'histocompatibilité (MHC) est un groupe de gènes important de reconnaissance tissulaire

Il existe une forte tendance à maintenir un certain niveau d'hétérogénéité, souvent gage de meilleures résistance aux agents pathogènes et partant un impact sur la sélection sexuelle

D'où l'hypothèse de travail émise par Claus Wedekind et Sandra Furi:

Est-ce que l'odeur personnelle favorise certaine combinaison de MHC ou plus simplement l'hétérogénéité ?

Plan expérimental:

6 T-shirts portés par 2 femmes et 4 hommes sont donnés à humer à 121 sujets hommes et femmes et à classer en fonction de leur odeur plaisante ou désagréable

Résultats :

une nette préférence l'odeur est corrélée à l'hétérogénéité du MHC entre le celui du porteur de T-shirt et le sujet

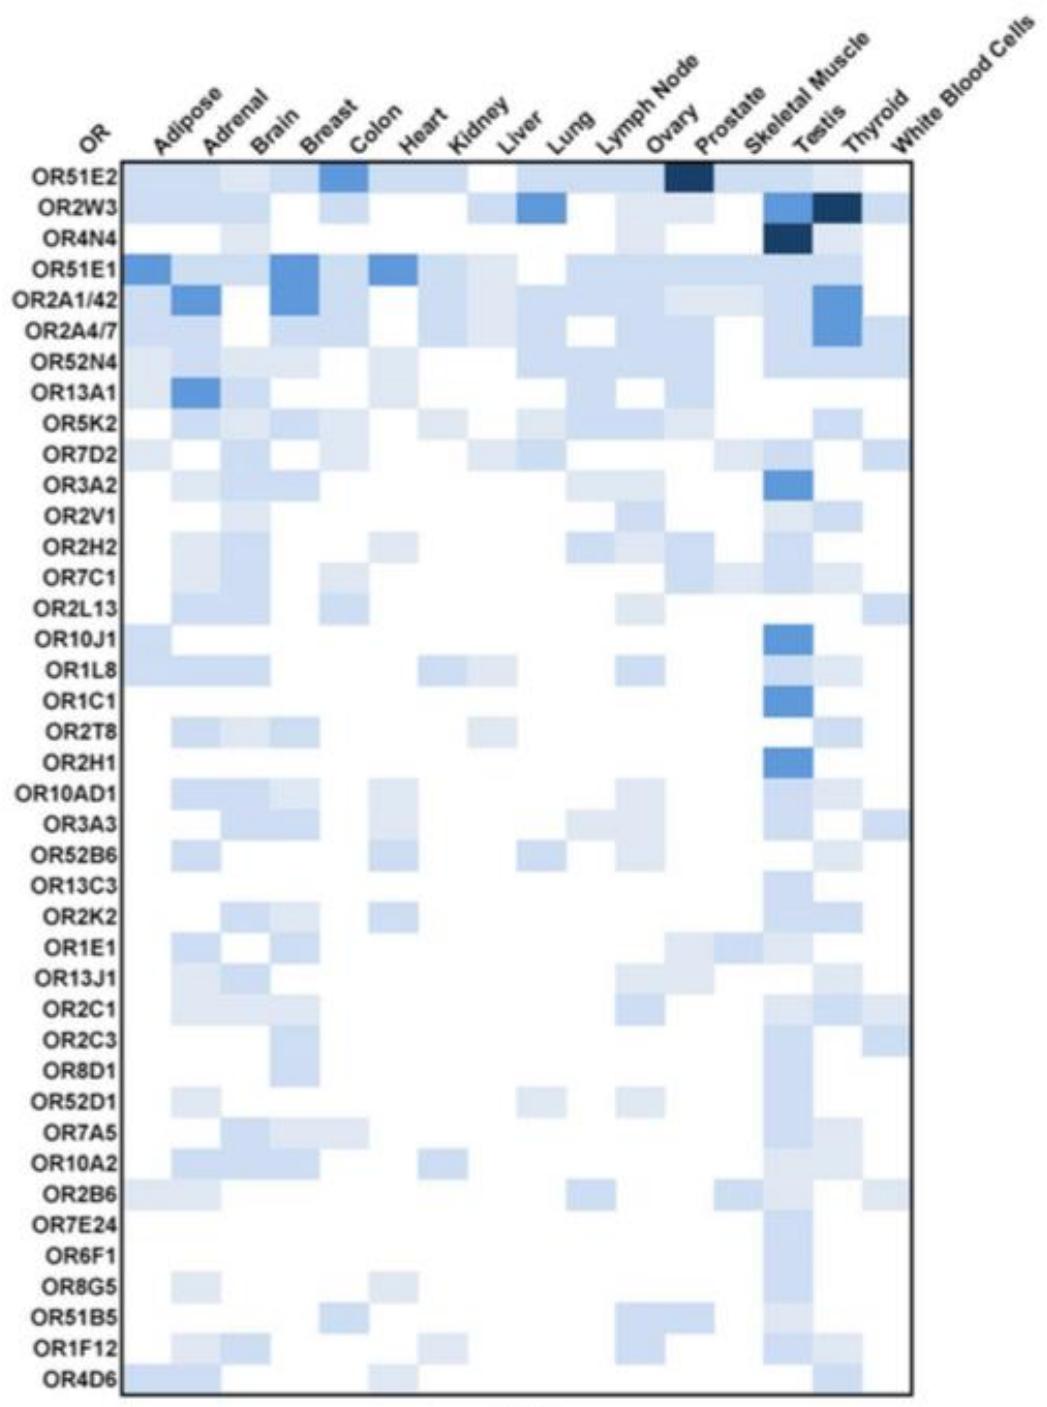

- De nombreuses questions restent en suspend aussi bien sur l'efficacité de ce sens que sur l'impact de l'odorat sur le comportement individuel

MAIS

A UNIQUE CURRICULUM

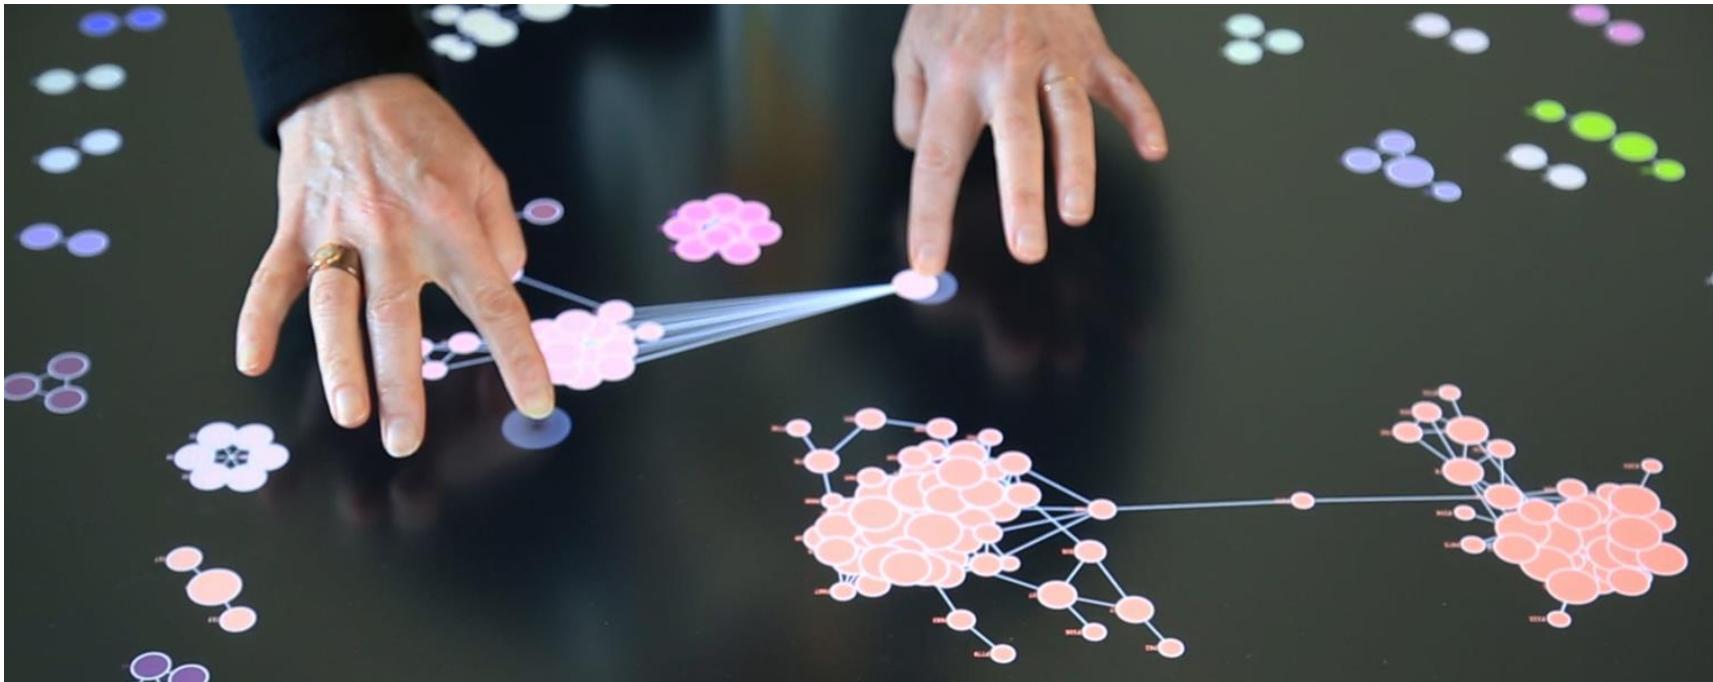

E-gredients

Based on the most recent innovations in terms of memorization, the new e-ingredients tool developed for the Givaudan Perfumery School students is a learning platform that enables them practice about **over 500 raw materials** in a self-motivated way.

A UNIQUE CURRICULUM

The formulation of tomorrow

“Innovation has always been at the heart of Givaudan’s strategy. We are constantly looking for ways to leverage technological developments to enhance the way we work, and to delight our customers and consumers.”

Calice Becker, VP Perfumer and Director of the Perfumery School

A UNIQUE CURRICULUM

Learn & Share

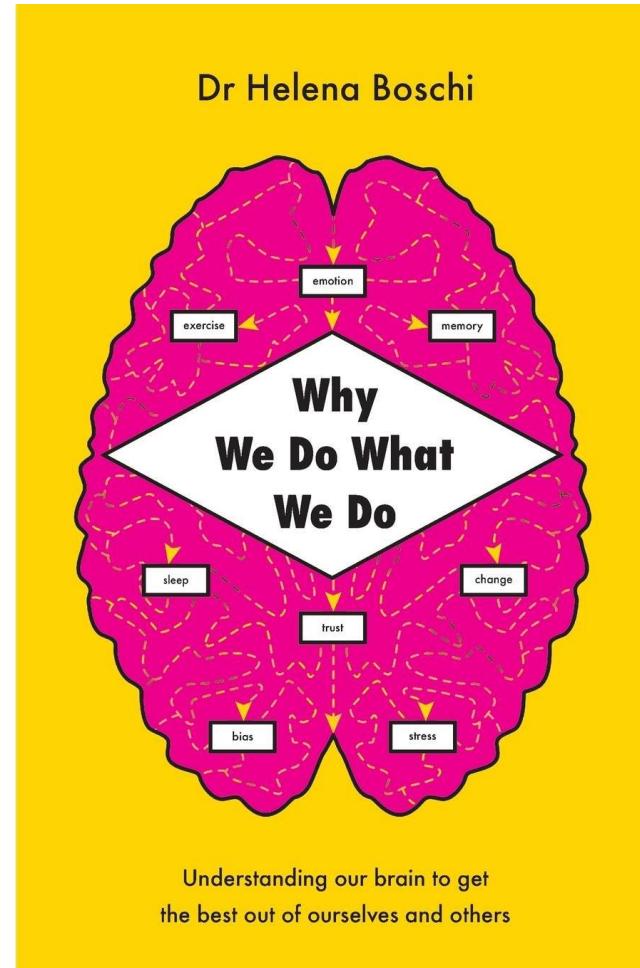

HOURS

At all stages of their training at the Givaudan Perfumery School the students are encouraged to collaborative learning through exercises such as the Learn & Share sessions.

A UNIQUE CURRICULUM

Developing soft skills

A UNIQUE CURRICULUM

Making the most of Givaudan ressources

A UNIQUE CURRICULUM

A culture of curiosity

WITH LOVE FOR NATURE

Creating from nature

Since 2018 the students of the Givaudan Perfumery School can work their accords from nature thanks to the "Garden of Scents" and "Garden of Flavors" that give them an immediate access to more than 200 species of fragrant plants (among which 100 species of roses).

PARKINSON'S SMELL TEST EXPLAINED BY SCIENCE

MA MADELEINE

The Problem :

During the Covid-19 pandemic, the medical community noticed that the sense of smell could be durably affected by the virus. More specifically, as patients regenerate slowly their sense of smell, they have to face partially or completely « new » odorants perceptions different from their smells memories, and sometimes unpleasants (paromia). Our scientists team has found that these patients olfactory dysfunction takes on central olfactory impairments properties.

Our Solution :

Onepoint, Givaudan, the Nice University Hospital and the Université Côte d'Azur have joined forces to create Ma Madeleine, a protocol dedicated to rehabilitating the sense of smell by taking into account the semantic aspects of odors. It includes an olfactory kit containing 12 high fidelity odorants and a Web-App used to guide the training at home.

Our ambition :

Deliver a qualitative and effective smell reeducation experience to the millions of people affected by smell impairment.
